BirdID

The Hague Bird Identifier

A photograph. A suggestion.
A starting point for learning.

ROBOFLOW / DINOv3 SMALL

Reference image from our Roboflow model screenshot

DEMO: https://youtu.be/2BRMIEG2k7c

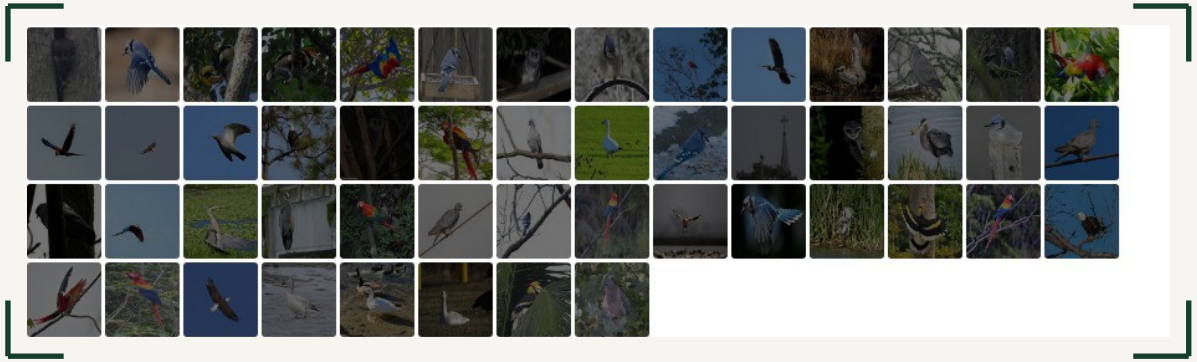

Make biodiversity easier to explore

A familiar question

“What bird might this be?”

SDG 15: Life on Land

For students and beginner birdwatchers.
A learning aid, not a wildlife census.

Notice. Identify. Learn.

Local audience; local species coverage still needs independent validation.

One photo in. One suggestion out.

INTENDED WORKFLOW

01

Upload photo

Local Streamlit app

→

02

Run inference

Roboflow-hosted model

→

03

Read the output

Category + model score

→

04

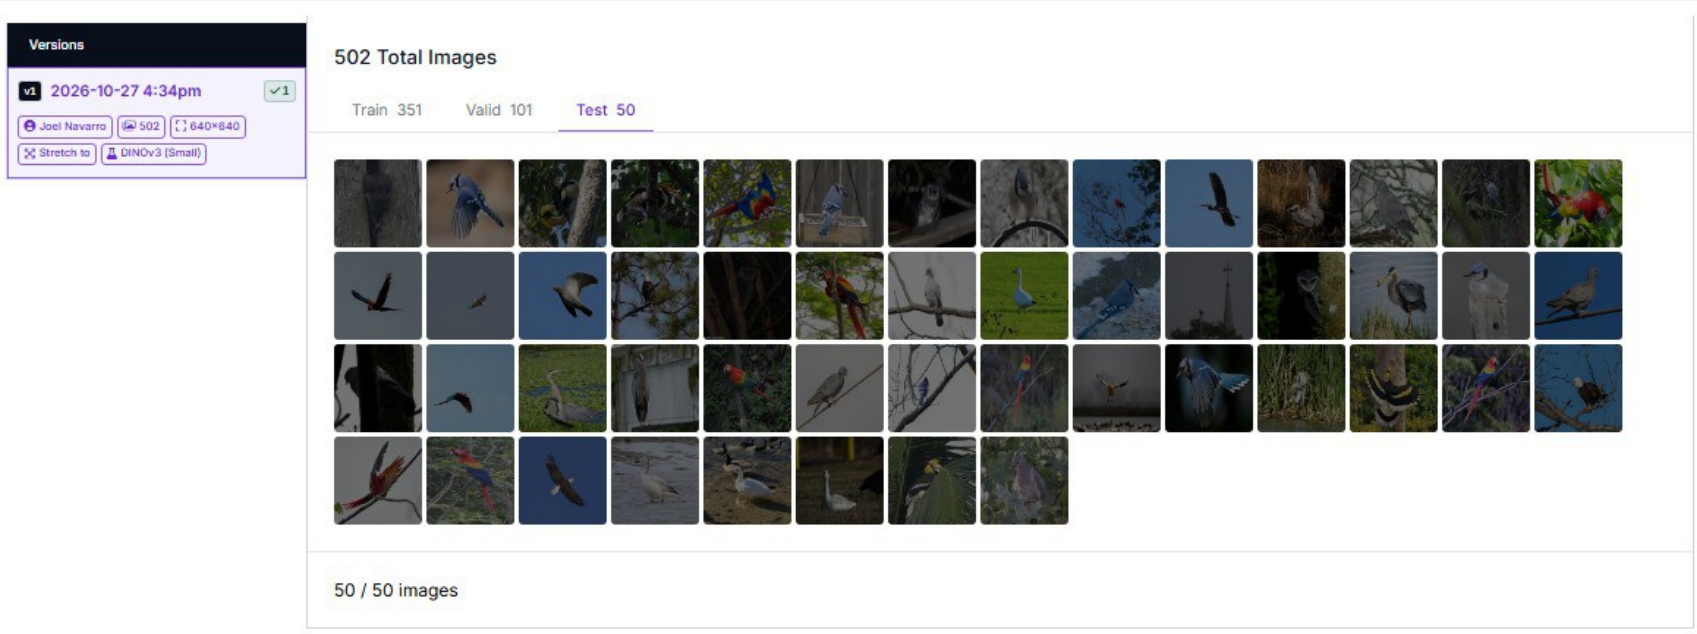

Verify the result

Or record no prediction

Local interface does not mean offline inference.

Internet access is required; uploaded images go to Roboflow. Keep the API key private.

502 labelled images. A local-data gap.

502

labelled images

DINOv3 Small

8 categories reported

351 training **101** validation **50** test

Reused Universe dataset; not collected by our team.

Strong test scores are not field validation

100%
Precision

97.5%
Recall

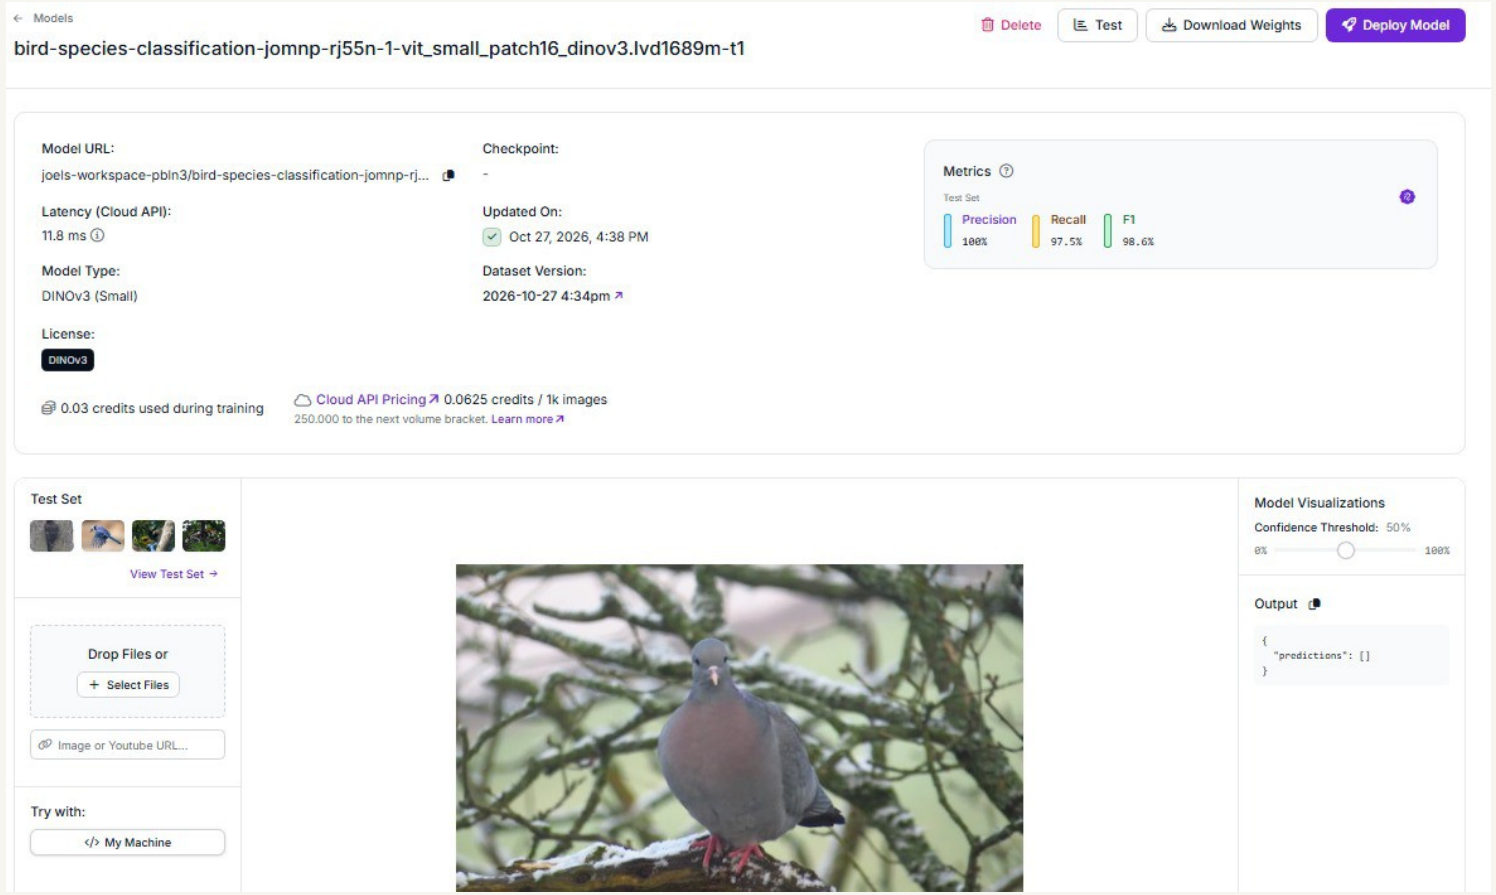

98.6%
F1 score

11.8 ms server-side median latency

Live demo: upload an unseen photograph

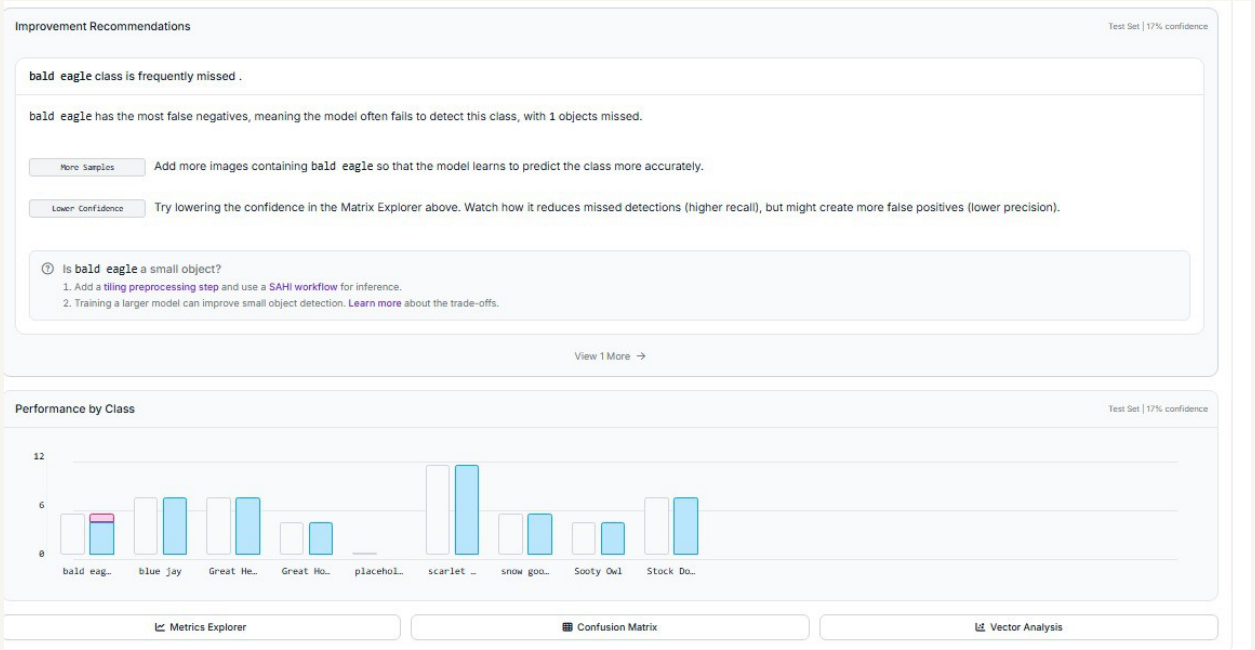

1. **Start the local app**
2. **Upload a new bird photo**
3. **Show the output + score**
4. **Check the label independently**

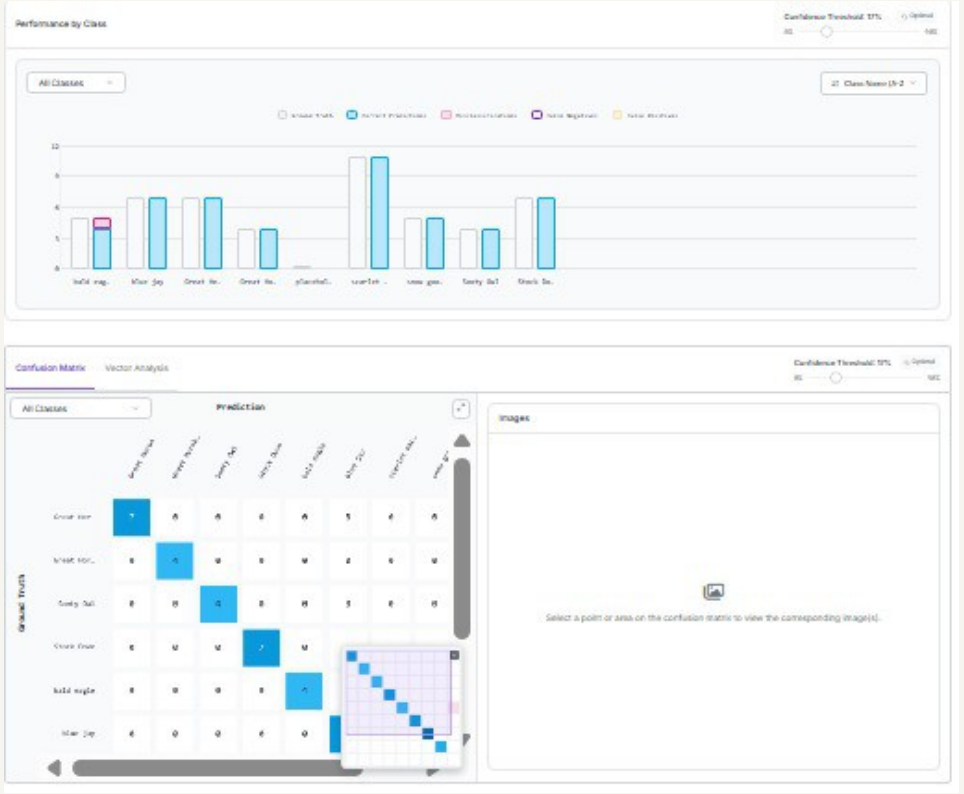

```
python -m streamlit run app.py
```

Reference: Roboflow model page, not a recorded app result

Class-level errors still matter

1 bald-eagle example missed

At 17% confidence, on the test split.

Audit the category labels.

Responsible AI starts with the data

Data honesty

Imported images; Dutch provenance
and licence attribution need checking.

Human oversight

Suggestions are not wildlife records.
Do not automate conservation decisions.

Privacy & security

Protect people, nest locations and keys.
Explain that images go to Roboflow.

The assignment’s original Dutch-data collection requirement is not yet demonstrated.

Training is a milestone, not the finish line

01 A score needs context

Internal test results are not local field evidence.

02 Data relevance matters

Image count alone does not establish Dutch coverage.

03 A usable app matters

The local app still needs a recorded end-to-end test.

NEXT TO VERIFY

- **Trained model**
  Complete
- **Qualifying Dutch dataset**
  Unresolved
- **Local app demonstration**
  Not yet verified
- **New-photo evaluation**
  Not yet documented

What would you test before trusting BirdID?

A suggested label is not a verified ecological fact.

Thank you. Questions?
